 Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

 Anote—"Organ: prostate; Vector: pT773D-Pac (Pharmacia)
with a modified polylinker; 1st strand cDNA was prepared
a normal prostate bulk tissue, and was then primed with
a Not I - oligo(dT) primer. Double-stranded cDNA was
ligated to Eco RI adaptors (Pharmacia), digested with Not
and cloned into the Not I and Eco RI sites of the
modified pT773 vector. Library is normalized, and was
constructed by Bento Soares and M. Fatima Bonaldo. "

WARNING: There is evidence that suggests that the 384-well parent
plate of this clone contains both human and mouse derived clones.
Thus, the origin of this clone is uncertain. This caution should be
kept in mind should you use this clone.

Human double-stran
Human secreted pro
 prostate
 for detecting and treating prostate cancers

Claim 1; Page 84-85; 141pp; English.

This sequence represents a human prostate tumour specific gene, and can be used in the method of the invention. The method is for detecting prostate cancer comprises contacting a biological sample with an agent able to bind an immunogenic portion of a prostate protein (such as encoded by this sequence). An antibody which binds to an immunogenic portion of the prostate protein, and the method can be used to detect, monitor progression of, or treat prostate cancers. The antibody may also be conjugated to a therapeutic agent for use in therapy of prostate cancers.

P-PSDB; W71869.
Polypeptides comprising immunogenic portions of prostate proteins -
used in a vaccine for the treatment of prostate cancer
Claim 3; Page 79-80; 130pp; English.
The present sequence is a new DNA which encodes an immunogenic portion
of a prostate tumour protein. The encoded immunogen, or the DNA itself,
can be used as a vaccine for the treatment of prostate cancer. The DNA
was identified by analysis of a subtracted cDNA library obtained by
subtracting a prostate tumour cDNA expression library with a normal

 Products for the diagnosis and treatment of prostate diseases, e.g. benign hyperplasia, prostatic or prostate cancer claim 1; Fig 1A-E; 122pp; English.

The present sequence represents the consensus sequence for a PS108 general sequence is derived from overlapphing clones V71166-79; The clone sequences are PS108 gene-specific. They are used in the method of the invention. The specification describes a method for detecting the presence of a target PS108 polynuclecitide in a test sample. The method comprises contacting the test sample with at least 1 PS108-specific polynuclecitide. The products can be used for detecting, diagnosing, prospecification, in vivo imaging, preventing or treating, or determining predisposition to diseases or conditions of the prostate such as benign prostatic hyperplasia (BPH), prostatitis, products can be used in darug screening and gener therapy.

Products can be used in drug screening and gene therapy.

Polypeptides comprising immunogenic portions of prostate proteins - used in a vaccine for the treatment of prostate cancer Claim 3; Page 38-39; 130pp; English.

The present sequence is a new DNA which encodes an immunogenic portion of a prostate tumour protein. The encoded immunogen, or the DNA itself, can be used as a vaccine for the treatment of prostate cancer. The DNA was identified by analysis of a subtracted cDNA library obtained by subtracting a prostate tumour cDNA expression library with a normal tissue cDNA library.

Sequence 789 BP; 122 A; 250 C; 221 G; 182 T;

 for detecting and treating prostate cancers

Claim 1: Page 39-40; 141pp; English.

This sequence represents a human prostate tumour specific gene, and can be used in the method of the invention. The method is for detecting prostate cancer comprises contacting a biological sample with an agent able to bind an immunogenic portion of a prostate protein (such as encoded by this sequence). An antibody which binds to an immunogenic portion of the prostate protein, and the method can be used to detect, monitor progression of, or treat prostate cancers. The antibody may also be conjugated to a therapeutic agent for use in therapy of prostate

The present sequence is a new DNA which encodes an immunogenic portion of a prostate tumour protein. The encoded immunogen, or the DNA itself, can be used as a vaccine for the treatment of prostate cancer. The DNA was identified by analysis of a subtracted cDNA library obtained by subtracting a prostate tumour cDNA expression library with a normal tissue cDNA library. 221 A; 202 C; 170 G; 167 T.

New isolated prostate-derived nucleic acids - used to develop products which may have cytokine, immune regulatory, haematopoiesis regulating, anti-inflammatory or tumour inhibition activity claim 1; Page 224; 675pp; English.

X40438 to X40715 represent 5' expressed sequence tags (ESTS) for human secreted proteins expressed in prostate, and encode the proteins given in Y11716 to Y11993 respectively. The proteins given represent the signal peptide and an N-terminal fragment of a secreted protein. The nucleic acid sequences can be used for producing secreted human gene products. They can also be used to develop products for diagnosis and therapy. The profeins obtained may have cytokine activity, cell proliferation and
 haemostatic;

Nucleotide sequences V71166-79 represent overlapping clones comprising the sequence V71180 and the consensus sequence V71181. The sequences are PS108 gene-specific. They are used in the method of the invention. The specification describes a method for detecting the presence of a method for detecting the presence of a trarget PS108 polynucleotide in a test sample. The method comprises contacting the test sample with at least 1 PS108-specific polynucleotide or complement, and detecting the presence of the target PS108 polynucleotide. The products can be used for detecting, diagnosing, staging, monitoring, prognosticating, in vivo imaging, preventing or treating, or determining presisposition to diseases or conditions of the prostate such as benign prostatic hyperplasia (BPH), prostatitis, prostatic intraaplithal neoplasa (PIN) and cancer. In particular the products can be used in drug screening and gene therapy.

Patent No. 5763174;
GENERAL INFORMATION:
APPLICANT: Nishikura, Kazuko
TITLE OF INVENTION: RNA Editing Enzyme and Methods
TITLE OF INVENTION: of Use Thereof
NUMBER OF SEQUENCES: 67
                                                                                     COMPUTER REABLE FORM:
MEDIUT TYPE: Floppy disk
COMPUTER: IBM PC compatible
OPERATING SYSTEM: PC-DOS/NS-DOS
SOFTWARE: PATCHIN Release #1.0, Version #1.25
CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/08/457,459
FILING DATE:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Score 90.8; DB 2;

/note-rorgan: lung; Vector: pT/T3D-Pac (Pharmacia) with a modified polylinker; Plasmid DNA from the normalized library NCI_CGAP_Lu5 was prepared, and ss circles were made in vitro. Following HAP purification, this DNA was used as tracer in a bubtractive hybridization reaction. The driver was PCR-amplified cDNAs from a pool of 5,000 clones made from the same library (cloneIDs 1414920-1417991 and 1520904-1522439). Subtraction by Bento Soares and M. Fatima Bonaldo.

with a modified polylinker; 1st strand cDNA was prepared
from normal prostate bulk tissue, and was then primed with
a Not I - oligo(dI) primer. Double-stranded cDNA was
ligated to Eco RI adaptors (Pharmacia), digested with Not
I and cloned into the Not I and Eco RI sites of the
modified pT773 vector. Library is normalized, and was
constructed by Bento Scares and M. Fatima Bonaldo. "

/Account of the pawplo; Site_1: Not1; Site_2: EcoRI; 1st strand cDNA was primed with oligo(dT)17 on 50 ng of barand cDNA was primed with oligo(dT)17 on 50 ng of barand cDNA was primed ealular RNA obstained from 5.000-10,000 microdissected, histologically normal prostate epithelial cells. Double-stranded cDNA was ligated to EcoRI adaptors, 5 cycles of PCR applied to the cDNA with an adaptor-specific primer, and the resulting PCR product subcloned into pAMPIO by the UDG-cloning method (Life Technologies). Average insert size is 600 bp. NOTE: Not directionally cloned. This library was constructed by David Krizman."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Eutheria; Metazoa; Chordata; Craniata; Vertebrata; Manmalla;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  with a modified polylinker; 1st strand cDNA was prepared with a modified polylinker; 1st strand cDNA was prepared from normal prostate bulk tissue, and was then primed with a Not I - oligo(dT) primer. Double-stranded cDNA was ligated to Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of the modified pT7T3 vector. Library is normalized, and was constructed by Bento Soares and M. Fatima Bonaldo. "

```
primed with
from normal prostate bulk tissue, and was then primed with a Not I - oligo(dT) primer. Double-stranded cDNA was ligated to Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of the modified pT/Ty vector. Library is normalized, and was constructed by Bento Soares and M. Fatima Bonaldo. "

Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified cDNAs from a pool of 5,000 clones made from the same library (cloneIDs 985608-986759, 1101192-11011959, and 1217928-1220615).

Clone HPWAE25 is a member of the TMASF receptor superfamily. The products generated using the receptor can be used for treating abnormal conditions related to both an excess of and insufficient amounts of receptor activity. They can be used in the treatment of e.g. immune disorders, cancers, blood disorders, juvenile rheumatoid arthritis, draves disease or immunocompromised disease states. The products can also be used for detection and diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New isolated poly:nucleotide(s) and encoded receptor poly:peptide(s) - used to develop products for diagnosing or treating e.g. immune disorders, cancers, blood disorders or immuno-compromised disease
                                                                                                                                                                                                                        27-OCT-1998 (first entry)

protein. Its amino acid sequence was deduced from a full-length at 415.4 cDAR clone (see V30916) isolated from a human adult retina cDNA library. The predicted amino acid sequence shows homology to human M35252 and C0-029 tumour associated antigens, and computer predictions suggest a potential transmembrane domain centered around amino acid 100 of the protein. Il Novel human secreted proteins (see W36380-90) are claimed. These can be expressed in recombinant host cells for analysis, characterisation, diagnostic or therapeutic use. They can also be used as tissue or mol.wt. markers, to generate antibodies, and in interaction trap assays. They may have biological activities, e.g. cytokine, immunomodulator, con inhibin activity, clasue growth activity, activity haematopolesis regulating activity, tissue growth activity, chaematopolesis regulating activity, receptor/ligand activity, and tumour inhibition activity. The proteins can be expressed in vivo from DNA, introduced in gene therapy vectors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               322
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     372
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   472

Disclosure; Fig 1A-1C; 54pp; Bradish.

Disclosure; Fig 1A-1C; 54pp; Bradish.

This is the amino acid sequence of the human tumour-associated antigen (PRAT) used in the method of the invention for stimulating cell proliferation and screening for antagonists useful to treat or prevent cell proliferation and screening for antagonists useful to treat or prevent cell proliferation be combined with a suitable carrier in pharmaceutical compositions, and also used to screen for antagonists, agonists, and to generate antibodies. PRAT agonists can be addinistated to a cell to stimulate cell proliferation by increasing or prolonging the activity of PRAT as above. The antagonists can be administered to subjects to treat or prevent discretisms, which can be administered to subjects to ricea to represent discretism or prevent discretism or propositions, which can be administered to subjects to treat or prevent discretism or prevent discretism or propositions, which can be administered to subjects to treat or prevent discretism or delivery mechanism to bring pharmaceutical agents to therefore the confine the repeated by PRAT expression and to monitor therapeutic interventions. The polynucleotide encoding PRAT, or complementary can be used to produce hybridisation probes, useful to disanose diseases characterides or fragments encoding PRAT, e.g. to disanose diseases relating to polypeptide expression or monitor PRAT regulation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   02-DEC-1998 (first entry)
Amino acid sequence of the human tumour-associated antigen.
Human: tumour-associated antigen; PRAT; stimulation; cell proliferation; antagonist; cancer; genetic defect; sickle cell anaemla; agonist;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human tumour-associated antigen PRAT - useful for stimulating cell proliferation and screening for antagonists useful to treat or prevent cell proliferation disorders e.g. cancers

NOVEL human prostate specific tumour protein and fragments - useful for detecting and treating prostate cancers

Novel human prostate specific tumour protein and fragments - useful for detecting and treating prostate cancers

Novel human prostate specific tumour specific gene, and sample 1; Page 89-90; 141pp; English.

This sequence is encoded by a human prostate tumour specific gene, and can be used in the method of the invention. The method is for detecting prostate cancer comprises contacting a biological sample with an agent able to bind an immunogenic portion of a prostate protein (such as this protein sequence). An antibody which binds to an immunogenic portion of the prostate protein, and the method can be used to detect, monitor progression of, or treat prostate cancers. The antibody may calso be conjugated to a therapeutic agent for use in therapy of prostate

The present sequence is an immunogenic portion of a prostate tumour protein. The immunogen, or the DNA encoding it, can be used as a vaccine for the treatment of prostate cancer. The immunogen was isolated from a prostate tumour cDNA library obtained by subtracting a prostate tumour cDNA library with a normal tissue cDNA.

```
The invention relates to 70 moved compared to their fragments (nucleic acid sequences: V34154-V34276; amino acid sequences W7557-W75179) which are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Also pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new polypuccleotides. Specific uses are described for each of the 70 polynucleotides, based on which tissues they are most highly expressed in (see V34154 for described
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 disorders, immune diseases, inflammation or blood disorders claim 1; Page 281-282; 447pp; English.

This sequence represents a secreted human protein encoded by the gene clone detailed in the descriptor line.

The gene can be used to generate fusion proteins by linking to the gene to a human immunoglobulin Fc portion (e.g. V34145) for increasing the stability of the fused protein as compared to the human protein only.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New isolated human genes and the secreted polypeptides they encode - useful for diagnosis and treatment of e.g. cancers, neurological

New isolated prostate-derived nucleic acids - used to develop products which may have cytokine, immune regulatory, haematopoiesis regulating, anti-inflammatory or tumour inhibition activity (laim 34: Page 605: 675pp; English.

X40438 to X40715 represent 5' expressed sequence tags (ESTS) for human secreted proteins expressed in prostate, and encode the proteins given in Y11716 to X11993 respectively. The proteins given represent the signal peptide and an N-terminal fragment of a secreted protein. The nucleic acid sequences can be used for producing secreted human gene products. They can also be used to develop products for diagnosis and therapy. The proteins obtained may have cytokine activity, call proliferation and differentiation activity, hamatopoiesis regulating activity, tissue growth regulating activity, reproductive hormone regulating activity,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; EST secreted protein SEQ ID No: 483.

```
chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, receptor/ligand activity, anti-inflammatory activity, tumour inhibition activity or other activities. The products can be used in forensic, gene therapy and chromosome mapping procedures. The sequences can also be used for obtaining corresponding promoter sequences. The nucleic acids encoding the signal peptides can be used for directing extracellular secretion of a polypeptide or the insertion of a polypeptide into a membrane, or importing a polypeptide into a cell. Sequence 108 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           12-JUN'1999 (first entry)
Human secreted protein encoded by 5' EST SEQ ID NO: 173.
Human; secreted protein: EST; expressed sequence tag; diagnosis;
forensic; gene therapy; chromosome mapping; signal peptide;
upstream regulatory sequence; cytokine activity; cell proliferation;
differentiation; haematopolesis regulation; tempoductive hormone regulation; chemotactic; chemokinetic; haemostatic;
thrombolytic; anti-inflammatory; tumour inhibition.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New isolated brain-derived nucleic acids - used to develop products
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        which may have cytokine, immune, regulatory, haematopoiesis

regulating, anti-inflammatory or tumour inhibition activity
Claim 34; Page 543-544; 577pp; English.

CX X5178 To X52019 represent 5' expressed sequence tagg (ESTS) for human
secreted proteins, and encode the proteins given in Y12987 to Y13219,
CC respectively. The proteins given represent the signal peptide and an
N-terminal fragment of a secreted protein. The nucleic acid sequences
can be used for producing secreted human gene products. They can also
be used to develop products for diagnosis and therapy. The proteins
co obtained may have cytokine activity, cell proliferation/differentiation
activity, haematopoiesis regulating activity, tissue growth regulating
activity, namenatopoiesis regulating activity, chemotactic/
chemokinetic activity, haemostatic and thrombolytic activity, receptor/
condemnial activity, anti-inflammatory activity, tumour inhibition activity
and chromosome mapphing procedures. The sequences can also be used for
obtaining corresponding promoter sequences. The nucleic acids encoding
the signal peptide can be used for directing extracellular secretion of
a polypeptide into a cell.

Nucleic acid characteristic of late or early passage cells immortalised by papilloma virus - and related polypeptide(s) and antibodies, used for diagnosis and treatment of cervical cancer and assessing potential for progression of cervical lesions.

This protein, C4, si derived from a human papillomavirus (HPV) immortalised human foreskin kertinocyte cell line HBK-1A and is characteristic of late or early passage cells. This sequence is used in method for assessing the potential for progression of cervical lesions. Antibodies generated against the encoded polypeptide are used for diagnosis of cervical cancer and to assess potential for lesion progression. Antibodies can also be used therapeutically by inhibiting the polypeptide. Antisense molecules based on the nucleotide sequence are used to inhibit expression of the protein. Detecting polypeptides, or related RNA, characteristic of late passage cells (which are potentially malignant) in cervical smears is a reliable way of

Products which may have cytokine, immune regulatory, haematopoiesis

Products which may have cytokine, immune regulatory, haematopoiesis

The constant infilamatory or tumour inhibition activity

Claim 34: Page 590-591; 675pp; English.

Constant to x40715 represent 5' expressed sequence tags (ESTS) for human

Constant to x40715 represent 5' expressed sequence tags (ESTS) for human

Constant to x40715 represent 5' expressed sequence tags (ESTS) for human

Constant to x40715 represent 5' expressed sequence tags (ESTS) for human

Constant to x40715 represent 5' expressed sequence tags (ESTS) for human

Constant and an N-terminal fragment of a secreted proteins given in

Constant and an N-terminal fragment of a secreted proteins. The nucleic

Constant sequences can be used for producits for diagnosis and therapy. The

Constant sobtained may have cytokine activity, cell proliferation and

differentiation activity, haematopoiesis regulating activity, tissue

Constant regulating activity, haemostatic and thrombolytic activity,

Chemotactic/chemokinetic activity, hemostatic and thrombolytic activity,

chemotactic/chemokinetic activity, haemostatic and thrombolytic activity,

constituty or other activity, anti-inflammatory activity, tumour inhibition

continity or other activity, anti-inflammatory activity, tumour inhibition

continity or other activity, anti-inflammatory activity, tumour inhibition

continity or other activity procedures requences. The nucleic acids

continity has signal peptides can be used for directing extracellular

secretion of a polypeptide or the insertion of a polypeptide into a

constant and a polypeptide into a cell.

Constant and and and and and and an activity and a polypeptide into a cell.
                                   forensic; gene therapy; chromosome mapping; signal peptide; prostate; upstream regulatory sequence; cytokine activity; cell proliferation; differentiation; haematopoiesis regulation; tissue growth regulation; reproductive hormone regulation; chemotactic; chemokinetic; haemostatic; thrombolytic; anti-inflammatory; tumour inhibition.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    123 ATGCAGTGCTTCAGCTTCATTAAGACCATGATGATCCTCTTCAATTTGCT 172

NAME OF THE PROPERTY OF THE PR
```

```
The present sequence represents a kidney injury associated molecule (KIM) protein. KIM proteins can be administered therapeutically by expressing KIM encoding polynuclecitides, to promote growth and/or by expressing KIM encoding polynuclecitides, to promote growth and/or curvival of damaqed tissue (e.g. renal tissue), since the KIM proteins are upregulated in injured or regenerating (especially renal) tissues. KIM thaion proteins, conjugates, antibodies and vectors can also be used therapeutically, e.g. these or the KIM proteins may be included with an acceptable carrier in pharmaceutical compositions, useful for therapy/ prophylaxis of conditions associated with disfunction/disregulation of KIM genes or proteins, especially renal diseases or impairments of renal function in humans (e.g. acute renal failure, acute nephritis). The polynucleotides can be used to produce antisense sequences which, when internalised into cells, can disrupt expression of a cellular KIM gene, also useful in therapy (e.g. to block the growth of tumours dependent on the growth or empositions. The proteins and polynucleotides are useful diagnostically e.g. to detect and quantify renal injury or impaired function), or abnormal responses to tissue injury (indicative of increased risk, or presence of, renal injury or impaired tissue growth arising from/affecting renal tissue). The proteins can also be used to locate KIM-producing/expressing KIM such as tumours arising from/affecting renal tissue), by contacting cells with an enumbered talk and imaging reagent accumulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Kidney injury-associated molecule, KIM, polypeptides - upregulated in injured or regenerating tissues, useful to promote tissue growth and regeneration, especially to treat renal conditions Claim 17; Page 161-162; 219pp; English.
                                                                                                                                                                    Kidney injury associated molecule HWO82 protein.
Kidney injury associated molecule, Kidney injury related molecule,
Kidney injury associated molecule, regeneration; renal condition;
acute renal failure; acute nephritis; tumour.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   20

Clone HTBPA27 is a member of the TM4SF receptor superfamily. The products generated using the receptor can be used for treating abnormal conditions related to both an excess of and insufficient amounts of receptor activity. They can be used in the treatment of e.g. immune disorders, cancers, blood disorders, juvenile rheumatoid arthritis, also be used for detection and diagnosis. The products can sequence 238 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            N-PSDB; V48117.
New isolated poly:nucleotide(s) and encoded receptor poly:peptide(s)
- used to develop products for diagnosing or treating e.g. immune
disorders, cancers, blood disorders or immuno-compromised disease

Example 2; Fig 3; 49pp; English.

Example 2; Fig 3; 49pp; English.

The 29.6 kDa human KAII protein (W05732) is the product of the numan metastasis tumour suppressor gene KAII (T40021), and is expressed in many tissues. Recombinant KAII protein can be capplus. Alterations in the protein sequence are indicative of the presence of malignant cancer, or of a predisposition to malignancy, in a subject. Gene therapy can be used to restore the wild-type consumer.

Clone HHPER40 is a member of the TMASF receptor superfamily. The products generated using the receptor can be used for treating abnormal conditions related to both an excess of and insufficient amounts of receptor activity. They can be used in the treatment of e.g. immune disorders, cancers, blood disorders, juvenile rheumatoid arthritis, Graves disease or immunocompromised disease states. The products can also be used for detection and diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New isolated poly:nucleotide(s) and encoded receptor poly:peptide(s)
